from Pinus sylvestrise and which has pinosylvin-3-O-methyltransferase (PMT) and antifungal activity. (I) is involved in the methylation of pinosylvin. The products of the invention are useful for providing transgenic plants with part protection from pathogenic organisms. The regulation of the activity of PMT is biologically and economically important as it is involved in the methylation of its involved in the methylation of its solutions.

protein (I) isolated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a PCR primer used in the preparation of a thermostable mutant luciferase enzyme from Photinus pyralis (firefly). Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present tinvention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dhydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant luciferase enzyme comprising specific mutathermostability, useful in bioluminescent assays

Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2e compressing an exception vector and, 3) a plant comprising the transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
          Firefly luciferase catalyses the oxidation of luciferin wit resultant production of light. Luciferases (both wild type recombinant) lose activity quite rapidly when exposed to te

                                                                                                                                                                                                                                                                                                                                                                impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyademosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
                                                                                                                                                                                                                     nuclectide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 18 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation,
                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a PCR primer used in the preparation of a thermostable mutant luciferase enzyme from Photinus pyzalis (firefly). Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutant luciferase enzyme comprising specific mutations which increase its thermostability, useful in bioluminescent assays.

                                                                                                                                                                                                                                                       This oligonucleotide is specific for the PGK-Neo cassette of pMC5-RKO, a plasmid carrying the mouse melanocortin receptor MC5-R gene (see AAV63708). It was used with a primer (see AAV63704) specific for sequences external to the plasmid to screen AK47 embryonic stem cells following electroporation in the presence of pMC5-RKO. Positive clones were confirmed by Southern analysis. Recombinant targeting vectors were used to produce mice bearing a homozygous disruption of the MC5-R gene locus. Defects on the MC5-RKO mutant mice suggested a direct role for MC5-R in sebaceous glands production. Agonists and antagonists of MC5-R are used to treat disorders of exocrine gland function, e.g. of the lacrimal or sebaceous glands, particularly acne, other skin disorders and 'dry eye', also disorders related to oestrus, mating, gestation and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying compounds that bind to melanocortin receptors - stherapeutic agents for treating exocrine disorders like acne.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Melanocortin receptor; G protein coupled receptor; MC5-R; acne; therapy; mouse; pMC5-RKO; PCR; primer; ss.

                                                                                                                                                                     CC sequences. The amplified sequences were used to demonstrate the crimvention. The specification describes a composition of complexes of polynucleotide molecules covalently coupled to ligand moietles (e.g. avidin or neutral avidin (neutravidin)) to form a cross-linked structure. The composition allows incorporation of diverse oligancleotides or polynucleotides into a single complex for concomitant delivery into the same cell. The composition is used to deliver polynucleotides to viable cells. The method and compositions provide a new way of linking DNA molecules and are useful for gene over-expression and non-covalent cloning. The new system is called biotin-avidin networked gene (BANG) complexem. It is possible that the BANG system can be used to link multiple gene complexes to elicit broader immune reactions, e.g. as DNA vaccines. The BANG system can also be used as a cloning problems associated with

                                                                                        The invention relates to methods of determining a functional allele profile of a gene in a population. Functional allele profiles comprise the commonly occurring alleles in a population, and the relative frequencies at which such alleles of a given gene occur. The methods are used to identify and determine the frequency of the functional alleles of genes which display extensive allelic heterogeneity, particularly those implicated in disease or conditions, such as the BRCA1 gene associated with breast cancer, CFTR associated with cystic fibrosis, dystrophin associated with Duchenne muscular dystrophy and Becker muscular methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, a well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods also be employed for diseases where allelic and genetic heterogeneity exist, such as breast cancer, neurofibromatosis, and hereditary non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining

                                                     Containing a NF-kappaB recognising sequence, at least part of 3'-
Countranslated region (3'-UTR) of human-induced nitrogen monoxide synthase
Countranslated region (3'-UTR) of human-induced nitrogen monoxide synthase
Countranslated region (3'-Tlanking region. Also described are: (a)
Countranslated are: (a)
Countraling at least part of 3'-flanking region. Also described are: (a)
Countraling sequence
Countraling sequence in this order from the 5'-side; (c) a
Countraling a promoter region, (2) a reporter gene and (3) the above
Countraling sequence in this order from the 5'-side; (c) a
Countraling a substance controlling activation of NF-kappaB in which a cell
Countraling a substance controlling activation of NF-kappaB in which a cell
Countraling a substance controlling activation of NF-kappaB containing the above expression controlling activation of NF-kappaB containing the above cell;
Countraling activation of NF-kappaB containing the above cell;
Countraling method, and (g) a drug composition for treating diseases
Countraling method, and (g) a drug composition for treating diseases
Countraling method, and (g) a drug composition for treating diseases
Countraling method, and (g) a drug composition for treating diseases
Countraling method, and (g) a drug composition for treating diseases
Countraling method, and can evaluate a compound controlling
Countraling activation of NF-kappaB prepared by using the
Countraling method can evaluate a compound controlling
Countraling activation of NF-kappaB containing, with the above compound
Countraling activation of NF-kappaB containing the above controlling
Countraling activation of NF-kappaB containing the above compound
Countraling the countraling countraling the countraling the countraling countraling countraling cou
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAV35372-V35382 and AAV35385 are PCR primers used in the isolation of a fragment of human inducible nitric oxide synthase (hiNOS) which can be used to screen for potential hiNOS expression regulators. Such regulators have an effect on the modification of the expression (in the presence of a cytokine inducer) of a reporter gene in a human cell line transformed with an expression vector containing (in order from 5'-end): the 5'-flanking region of the hiNOS gene containing 544 bases, the reporter gene and the 3'-untranslated region of the hiNOS gene. Suitable reporter genes include chloramphenical acetyltransferase (CAT), beta-galactosidase (beta hiNOS gene are useful for the treatment of inflammation and sepsis, as antitumour agents and for the inhibition of re-angio-stenosis, and other conditions involving abnormalities of hiNOS expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Screening for regulators of human inducible nitric oxide synthase expression - using human cell line transformed with a reporter gene flanked by 5'-promoter and 3'-non-translated regions of the hiNOS gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 24; 56pp; Japanese.

The antisense oligonucleotide can be used to treat HIV-1 or HIV-2 infection in a mammal, or inhibit HIV-1 or HIV-2 in a cell. The oligonucleotide has less cell toxicity, provokes less immunostimulus than prior art, and is a GC-rich antisense HIV oligonucleotide

```

The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for endothelial nitric oxide. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway disease characterised by an other airway disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hype

Such markers be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic.

The present sequence represents a PCR primer for single stranded CC conformation polymorphism testing of the BRCA2 cancer susceptibility CG gene. The nucleic acid molecule can be used to construct probes for CC screening cDNA or genomic libraries, sequencing positive clones obtained, CC and assembling the full length BRCA2 sequence. The BRCA2 nucleic acid CC molecules and proteins are useful in a method of medical treatment, CC preferably gene therapy, especially for treating cancer, where the cancer colular melanoma or leukaemia. In particular antisense oligonucleotides capable of hybridising to the BRCA2 nucleic acid, pre-mRNA or mature mRNA are used so that the expression of the BRCA2 nucleic acid is reduced or CC prevented. The nucleic acid molecules are also useful in a method for colorected acid molecules are also useful in a patient. The nucleic acid molecules are also useful in a patient. The nucleic acid molecules are used to design probes or primers for PCR to determine or detect the presence of mutations in a sample of nucleic acid from a patient. The BRCA2 promoter region is useful for screening for CC substances which modulate the expression of nucleic acid under control of the promoter. Antibodies are used to determine the presence, amount or CC control of a BRCA2 polypeptide or its mutant forms. The color of the promoter substances which minic the activity of BRCA2 polypeptide, which can be useful to screen for binding partners, these are useful to screen for substances which minic the activity of BRCA2 polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

It was used with the Anchor primer in the PCR amplification of human liver 5', RACReady cDNA. The PCR product was used as template in a second PCR with the Anchor primer and nested primer ELA2 (AAT60013) in order to obtain the 5' end of human Elongin cDNA. This was combined with a partial clone obtd. by screening HUVEC cDNA, to provide a cDNA clone (AAT59997) for human blongin B (AAW13851), a subunit of a novel RNA polymerase transcription
                                                                   PCR primers (AAT61331 and AAT77158-86) were designed for amplification the human Batten disease CLN3 gene (see also AT61306) exons 1-15. The PCR primers for exon 5 are given in AAT77165 and AAT77166. Novel mutations (see also AAT61332-48) have been discovered in the CLN3 gene Bd patients using a combination of PCR, single strand conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Batten disease; ceroid lipofuscinosis; CLN3; diagnosis; human; gene therapy; polymerase chain reaction; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 22 BP; 1 A; 9 C; 3 G; 9 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 5; Page 40; 99pp; English

Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragments of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to LGMD2 disease. Fifty primers (AAT32510-59) were used to specifically amplify the exons and splice junctions of the calpain large subunit 1 gene as well as the regions containing the putative CAT, TATA boxes at the polyadenylation signal. Two primers (AAT32552, AAT32553) were used
                                                                                                                                                           encapsidation; transcomplementation; polymerase chain reaction; PCR; gene therapy; transfer vector; canine foetal cell line; DOGP29; packaging cell line; gag; pol; env; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Retroviral vector pFOCH29 was constructed from pUC19 by insertion of two LTRs from Friend virus, a primer binding site, an encapsidation sequence and viral gag sequences. A neomycin resistance gene derived from retrotransposon Tn5 was introduced between the two viral LTRs to produce pFOCH29-Neo. The amphotropic packaging cell line psi CRIP was transfected with pFOCH29-Neo and the culture supernatant was able to infect NIH 3T3 fibroblasts and produce infectious viral particles, as confirmed by PCR analysis. The PCR primers in AAT31198 and AAT43698 amplified a 900 bp fragment comprising the end of the gag gene and the proximal two-thirds of neoR from the supernatant of NH 3T3 cell lysate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for detecting beta-catenin mutations. The microchip comprises oligonucleotides ADQ26772-seqid:121, which are designed to detect a variety of mutations at mutational hot spots of the beta-catenin gene, fixed on the surface of a solid matrix. beta-catenin, which functions a a downstream transcriptional activator in the Wnt signalling pathway, i a sub-membrane component of the cadherin-mediated cell-cell adhesion system. The beta-catenin microchip of the invention can be used in studies to detect beta-catenin mutations and unravel the signal transduction mechanism and tumourigenesis related to beta-catenin gene, and so is useful in cancer research, for example in elucidation of the Wnt signaling related mechanism. The present sequence is an activation of the signal are activities of the category.
                                                             The sequences in AAQ23967 and AAQ23968 are used to amplify the tax gene sequence from human T-cell lymphotrophic virus I (HTLV-I). This family of viruses are linked to certain rare human T-cell malignacies. HTLV-I is linked with a chronic demyelinating disease of the central nervous system (CNS). These primers can also be used to detect possible chronic fatigue immunodysfuction syndrome (CFIDS) - associated virus (CAV) retroviral DNA in CFIDS patients using PCR.                                                                                                                           The retroviral vector pFOCH29-neo was constructed by inserting the neomycin resistance gene from retrotransposon Tn5 between the two LTRs derived from Friend murine leukaemia virus proviral sequences. The ability of the vector to infect NH3T3 cells was analysed by PCR using two primer pairs. The first pair (AAQ81043-4) amplified the 900 bp fragment from the end of the retroviral gag gene and comprising the proximal two thirds of the neomycin resistance gene; the second primer pair (AAQ81045-6) amplified the 610 bp fragment comprising the distal third of the NeoR gene and the proximal half of the LTR. (Updated on 25 MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a device that has at least one surface that contacts tissue and/or liquids of the human or animal body and is at least partly coated with a substance that mediates binding of biological materials. The new feature is that this substance is an aptamer. The device is particularly an implant, e.g. a scent, vascular prosthesis, heart valve, joint etc., but may also be a component of an extracorporeal circulation system, a nanomaterial for tissue englineering and vascular surgery, a catheter, contact lens, storage device for blood etc., also a bioreactor for isolation and culture of selected cell types, for production of substances or for growing organ replacements. The present sequence is an aptamer suitable for use in the device of the invention.
                        Selecting an animal for desired genotypic or potential phenotypic properties such as muscle mass and/or fat deposition, comprises to for a single nucleotide polymorphism in intron 3 of the IGF2 gene

CC island located in intron 3 of an IGF2 gene, and/or binding to a rectance of a nuclear factor is capable of binding to a cC stretch of nucleotides which in the wild type pig, mouse or human IGF2 gene is part of an evolutionary conserved CpG island, located in intron 3 cC of the IGF2 gene. The stretch is functionally equivalent to (ADQ80709). CC The nucleic acid modification in ADQ80709 comprises a G to A transition CC at IGF2-intron3-nt3072. (M1) is useful for selecting an animal with CC properties related to muscle mass, fat deposition, and/or teat number. CC properties related to muscle mass, fat deposition, and/or teat number. CC properties a method (M2) for modulating mRNA transcription of an IGF2 gene by modulating the activity of an evolutionarily conserved CpG island located in intron 3 of an IGF2 gene and/or modulating binding of a CC nuclear factor to an IGF2 gene. Also claimed is a method (M3) for identifying a compound capable of modulating mRNA transcription of an IGF2 gene and/or modulating binding of a CC modulating binding of a nuclear factor to an IGF2 gene. (M2) is useful for modulating mRNA transcription of an IGF2 gene in a cell or organism. CC (M3) and (M4) are useful for identifying compounds capable of modulating mRNA transcription of an IGF2 gene in a cell or organism. CC mRNA transcription of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene. Compounds identified are potentially useful for treating obesity, muscle deficiencies and diabetes. The present sequence collaborable in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method (M1) for selecting an animal for having desired genotypic or potential phenotypic properties. (M1) comprises testing the animal for the presence of a nucleic acid modification affecting: the activity of an evolutionary conserved CpG

                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (AMHP) WYETH.

The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                               The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human laminin alpha 4 (LAMA4) DNA which is located at chromosomal position 6q21.
                                                                                                                                                                                                                                                                                                                                                                                           Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.

Specifically, it refers to using CC intelligent primers to obtain an amplification product in order that the molecular mass of the amplicon can be determined by mass spectroscopy, CC which in turn identifies the pathogen found in the sample. The present invention describes the rapid detection and identification of an CC etiologic agent that does not required nucleic acid sequencing, and CC instead relies on the use of intelligent primers to target ribosomal RNA CC instead relies on the use of intelligent primers to target ribosomal RNA CC instead relies and the intelligent primer useful in pharmacogenetic analysis and medical diagnosis (including cancer CC diagnosis based on mutations and polymorphisms), or for detecting single nucleotide polymorphisms in blood typing or stereotyping of viruses. This clipture to deterrial strains, given in an exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ព្រះព្រះន
                                              The invention relates to a method of providing a biologically active completely by administering cells that are naturally immune privileged and content by administering cells that are naturally immune privileged and content by administering cells that are naturally immune privileged and content by active moiety in pharmacologically such that the cells apparatus so as to express biologically active moiety such that the cells caparatus so as to express biologically active moiety in pharmacologically active moiety convive. The method is useful for providing a biologically active moiety to cells in vivo. The method is useful for treating diseases and conditions requiring protein therapy such as Type I and Type II diabetes (insulin), parkinson's disease (tyrosine hydroxylase), neurodegenerative diseases of the central and sympathetic nervous system (neurotrophins), an amemia (erythropoietin), dwarfism (human growth hormone), diabetes insipidus (vasopressin) and haemophilia (Factors VIII and IX). The method is useful for providing hormones, enzymes or drugs to mammals including thumans, in need of sustained doses for extended periods. The method is also useful for delivering protein or peptide drugs to animals. The method is efficient, convenient and cost-effective for site-specific contents and representation of the immune-privileged cells at the site of interest. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obseity, infectious diseases, anorexis, cancer, neurodegenerative disorders, lateriary is diseases, parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Grosse WM, Smithson G, Larochelle WJ, Shimkets Boldog FL, Edinger SR, Chapoval A;

It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-JUL-2004 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                                                               Larochelle WJ,
Boldog FL, Ed
Chapoval A;
                    The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, annorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoletic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                 New isolated polypeptide, useful for treating or preventing associated with the polypeptide, e.g. diabetes, infectious cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                (RIEG/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obseity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anderson DW, Vernet CAM, Catterton E, Miller CE, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CE, Gerlach V, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg ME; Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K; Chapoval A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                                                                                                                                                                                                                                                   G 13
```

2004-355290/33

New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.

ü SEQ ij ö 490; 552pp; English.

The invention relates to human NOVX polypeptides and polynucleotides. isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.

                                                                                                                          isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, annorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; NOVX; 88; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; antidiabetic; anorectic; antimicrobial; anabolic; eating disorder; cytostatic; neuroprotective; nootropic;

The NI16 nucleic acid molecule and the encoded protein is useful in increasing systemic acquired resistance (SAR) gene expression in a plant. The present sequence is a PCR primer used for cloning Arabidopsis thaliand

                                                                                                                             The invention relates to a method of inducing or promoting dopaminergic neuronal development by enhancing proliferation, self-renewal, dopaminergic induction, survival, differentiation and/or maturation in a neural stem, progenitor or precursor cell, or other stem or neural cell by expressing a nuclear receptor of the Nurri subfamily above basal levels within the cell, and treating the cell with a Wnt ligand. The dopaminergic neuron is useful in screening for an agent for use in treatment of a neurodegenerative disease. The neurodegenerative disease includes Parkinson's disease, a Parkinsonian syndrome or neuronal loss. The success of the method of the invention was determined by PCR amplification of selected genes within the induced neuronal cells. This sequence represents a PCR primer used to amplify these genes to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Promoting dopaminergic neuronal development by enhancing proliferation a neural cell expressing Nurrl, useful in treating neurodegenerative diseases, such as Parkinson's disease, a Parkinsonian syndrome or

CC subject, and judging whether the subject has bronchial asthma or chronic cobstructive pulmonary disease. The marker gene comprises: (a) a group of CC gelse are stimulated with interleukin-13; or (b) a group of genes (S1) whose expression levels decrease when respiratory epithelial CC cells are stimulated with interleukin-13; or (b) a group of genes (S2) CC stimulated with interleukin-13; or (b) a group of genes (S2) CC testing for bronchial asthma or chronic obstructive pulmonary disease; (C (2) a kit for screening for a candidate compound for a therapeutic agent (C (2) a kit for screening for a candidate compound for a therapeutic agent (C (2) a mainal model for bronchial asthma or chronic obstructive pulmonary disease; (3) CC an animal model for bronchial asthma or chronic obstructive pulmonary (5) a CC method for producing an animal model for bronchial asthma or chronic obstructive pulmonary disease; (5) a marker gene, a ribozyme, a polynucleotide that suppresses the CC expression of the gene through an RNAi effect or an antibody recognising C a protein encoded by a marker gene; and (7) a DNA chip for testing for or screening for a therapeutic agent (1) has respiratory CC and antiasthmatic activities, and can be used in gene thrapy. The method CC is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, on which a grobe has been immobilised to assay a marker gene. (1) has respiratory CC control and antiasthmatic activities, and can be used in gene therapy. The method CC is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present CC bronchial asthma or chronic obstructive pulmonary disease. The present CC bronchial asthma or chronic obstructive pulmonary disease. The present CC bronchial asthma or chronic obstructive pulmonary disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level determined with the expression level of the marker gene in a biological sample from a healthy expression level of the marker gene in a biological sample from a healthy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a

                                                                                                                                                                                                                                                                                                                                                                                                                                             combinatorial library of compounds that are suspected of inhibiting TRAIL, detecting any interactions that occur and selecting compounds as appropriate. The present invention further describes inducing animals to develop experimental autoimmune encephalitis (EAE) by administration of an EAE-inducing agent followed by a TRAIL inhibitor to induce neuronal cell injury and measuring the response. Accordingly, the method provides a means to identify neuroprotective compounds that can be useful for the manufacture of compositions to treat the chronic inflammatory disease of multiple selerosis. This oligonucleotide sequence is a PCR primer used to amplify the murine TRAIL-R2 receptor (also known as DR5) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for screening compounds capable of inhibiting tumour necrosis factor related apoptosis inducing ligand (TRAIL) to induce neuronal cell injury. Specifically, it refers to a method of contacting TRAIL (also known as APO-2 ligand) with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

The mutation in (I) is a missense mutation causing an amino acid

CC substitution in (I) is a missense mutation of the ERMAP protein,

CC specifically causing an amino acid substitution in position 26, 57 and/or

CC 60 of the amino acid sequence of ERMAP. The mutation may also be a

CC deletion causing a shift in the reading frame of the ERMAP gene, where

CC the mutation occurs in nucleotide position 54, 76, 169, 179, 307 and/or

CC 308. The mutation is a silent mutation in nucleotide position 54 from C

CC to T, or a missense mutation in position 76 from C to T, a G to A in

CC opsition 169, and/or a C to G in position 178. The mutation may be a

CC deletion of nucleotide position 307 and 308 of the ERMAP gene (SEO ID NO:

CC useful for the detection of a Scianna antigen and/or for the

CC useful for the detection of a Scianna antigen and/or for the

CC useful for the detection of a Scianna antigen and/or for the

CC polynucleotide may also be used in the characterisation of monoclonal and

CC polynucleotide may also be used in the characterisation, and for the

CC assessment of affinity, avidity, sensitivity, specificity and/or

CC reactivity of anti-Sc antibodies. Sequences ADI03727-ADI03763 represent

CC PCR primers for amplifying the eleven exon fragments and parts of

                          neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                             New NOVX
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alsobrook JP, Alvarez E, Anderson DW, Boldog FL, Casman SJ; Cattercon E, Chapoval A, Crabtree-Bokor JR, Edinger SR, Ell-Ettenberg S, Gangolli EA, Gerlach VL, Gorman L, Gunther E, Gusev VY, Herrmann JL, Ji W, Kekuda R, Li L, Liu X, Macdov Maclachlan T, Walyankar UM, Mezick AJ, Millet I, Mishra VS; Padigaru M, Pana CEA, Peyman JA, Raha D, Rass Rieger DK, Rothenberg ME, Sciore P, Shenoy SG, Shinkets RA; Smitheon G, Spytek KA, Stone DJ, Vernet CAM, Voss EZ, Zhon

                                specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polypucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                  New NOVX
                                                                                                                                                                                         polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zhong

CC oligonuclectides are derived from a gene encoding or regulating CC dysfunction of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CC inflammation, allergies and/or bronchoconstriction and/or lung CC inflammation, allergies and/or bronchoconstriction and/or lung CC inflammation, allergies, asthma, impeded respiration, respiratory CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary CC trymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system content of the arti-sense oligon corresponding to the oligonuclectides into products that free adenosine into the system contents.

                                                                                 The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-2-like or BRCA-2-like or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or RT-PCR parimer used to semi-quantitatively measure gene expression in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proliferation, hematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOV substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. This sequence corresponds to a reverse PCR primer for one of the NOVX genes of the

                                                                                                                                                     This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                             Analysis of chemical modification of DNA involves obtaining sample of
to be analyzed, treating DNA with chemical reagents that result in
different base sequences, and determining sequence of resulting DNA.

                                                                                                                                                                                                                                                                                methyltransferase (CCoAOMT2) gene that indicates high digestibility. Also disclosed are four specific mutant CCOAOMT2 sequences that differ from a C264 amino acid (aa) reference sequence as given in ADK69905. The alleles are detected from presence of genetic polymorphisms, especially any of 18 specified, that have, relative to a fully defined 1181 base pair sequence given in the specification as ADK69904. These polymorphisms may be detected by selective hybridisation of probes or by amplification then determining the size of the amplicon. Alternatively, the encoded proteins are detected. The inventive method is especially useful for assessing digestibility of maize, particularly for selection of strains. The nucleic acid that encodes the favourable mutants can be used to prepare transgenic plants that have increased digestibility, and as a primer/probe for use in the new method and for production of mutant protein. The current sequence represents a primer used in an example from

New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.

Disclosure; SEQ ID NO 233; 323pp; English

The invention relates to novel NOVX protein and their encoding DNA's, at the corms of the proteins or sequences that are at least 95% identical CC to, or having one or more conservative amino acid substitutions in, the CC proteins. The polypeptides, nucleic acid molecules and antibodies are expected in the manufacture of a medicament for treating a syndrome CC associated with a human disease, preferably a NOVX-associated disorder. CC The nucleic acid molecules, polypeptides and antibodies are useful for CC treating, preventing or diagnosing diseases such metabolic disorders, CC diabetes, obssity, infectious diseases (viral, bacterial, fungal, CC helminthic, and protozoal), anorexia, cancer, cardiovascular diseases CC (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's CC disease, Parkinson's disease, epilepsy, immune disorders skin disorders, asthma, and various dyslipidemias. The nucleic acids and polypeptides may calso be used as targets for the identification of small molecules that condulate or inhibit e.g. neurogenesis, cell differentiation, cell

                                           The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal alrway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels CC of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of biquinone or lung surfactant in a subject s tissue, or treating bronchoconstriction.

CC lung surfactant in a subject s tissue, or treating bronchoconstriction.

CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the wino int/muh/whilehed not agreemence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                               This invention relates to a novel library of immunoglobulin (IgG) molecules. Specifically, it refers to prototype IgG molecules that each may comprise a mutation where a single predetermined amino acid has been substituted in one or more positions within one or more of the six complementarity-determining regions (CDRs) of the anti-HIV human GP-120 monoclonal antibody (scFV). The present invention describes a method for generating a library of prototype mutant IgGs (for example IgM, IgA, IgD or a Fab fragment of IgG), which can be used to study protein structure and function via a walk-through mutagenesis procedure. Accordingly, the libraries may be used for the systematic analysis of the binding regions of prototype IgG molecules. Furthermore, it provides specific information of prototype IgG molecules. Furthermore, it provides specific information regarding particular mutations that alter the interaction of an IgG with its antigen, micluding multiple interactions by amino acids of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New libraries for a prototype IgG (IgG) comprising mutated IgG or nucleic acids encoding a mutated IgG, useful for generating specific information on particular mutations that alter interaction of an IgG with its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GP120; antibody; scFV; ss; library; immunoglobulin; walk-through mutagenesis; anti-HIV; CDR;

useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample is metaphase to the target genomic nucleic acid of the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tissue or organism. The disease or condition may include pulmonary diseases such as restenosis, atherosclerosis, Alzheimer's disease, Parkinson's disease, epilepsy, darkinson's disease or amyotrophic lateral sclerosis. Furthermore, the siNA may be utilised for gene therapy applications. The current sequence is that of the siNA DNA-RNA hybrid of the invention.
